

# Containers - Continued!

**Anthony E. Nocentino**  
[aen@centinosystems.com](mailto:aen@centinosystems.com)

# Anthony E. Nocentino

- **Principal Field Solution Architect @ Pure Storage**
  - Specialize in system architecture and performance
  - Masters Computer Science
- **email:** [anocentino@purestorage.com](mailto:anocentino@purestorage.com)
- **Twitter:** @nocentino
- **Blog:** [www.nocentino.com](http://www.nocentino.com)
- **Pluralsight Author:** [www.pluralsight.com](http://www.pluralsight.com)

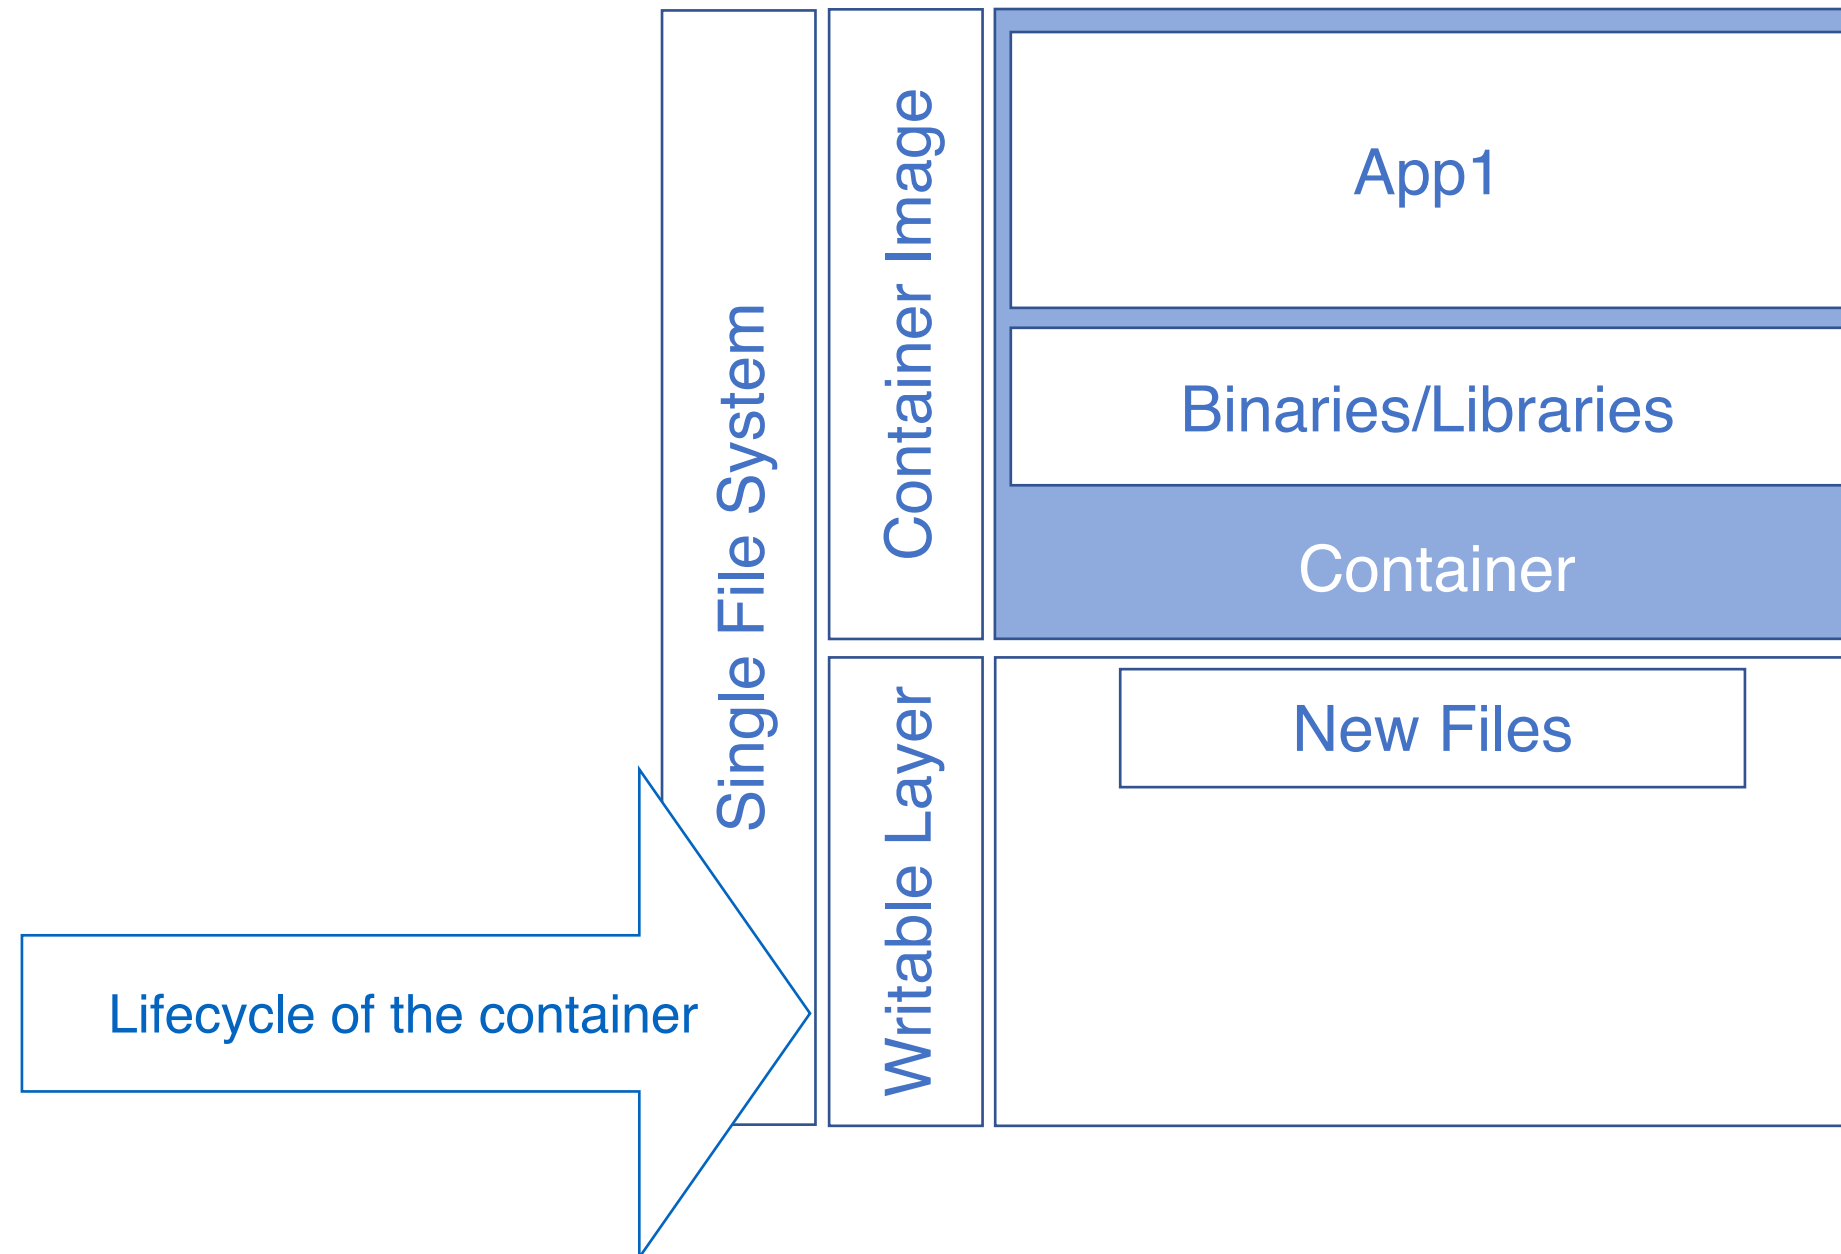

# Agenda

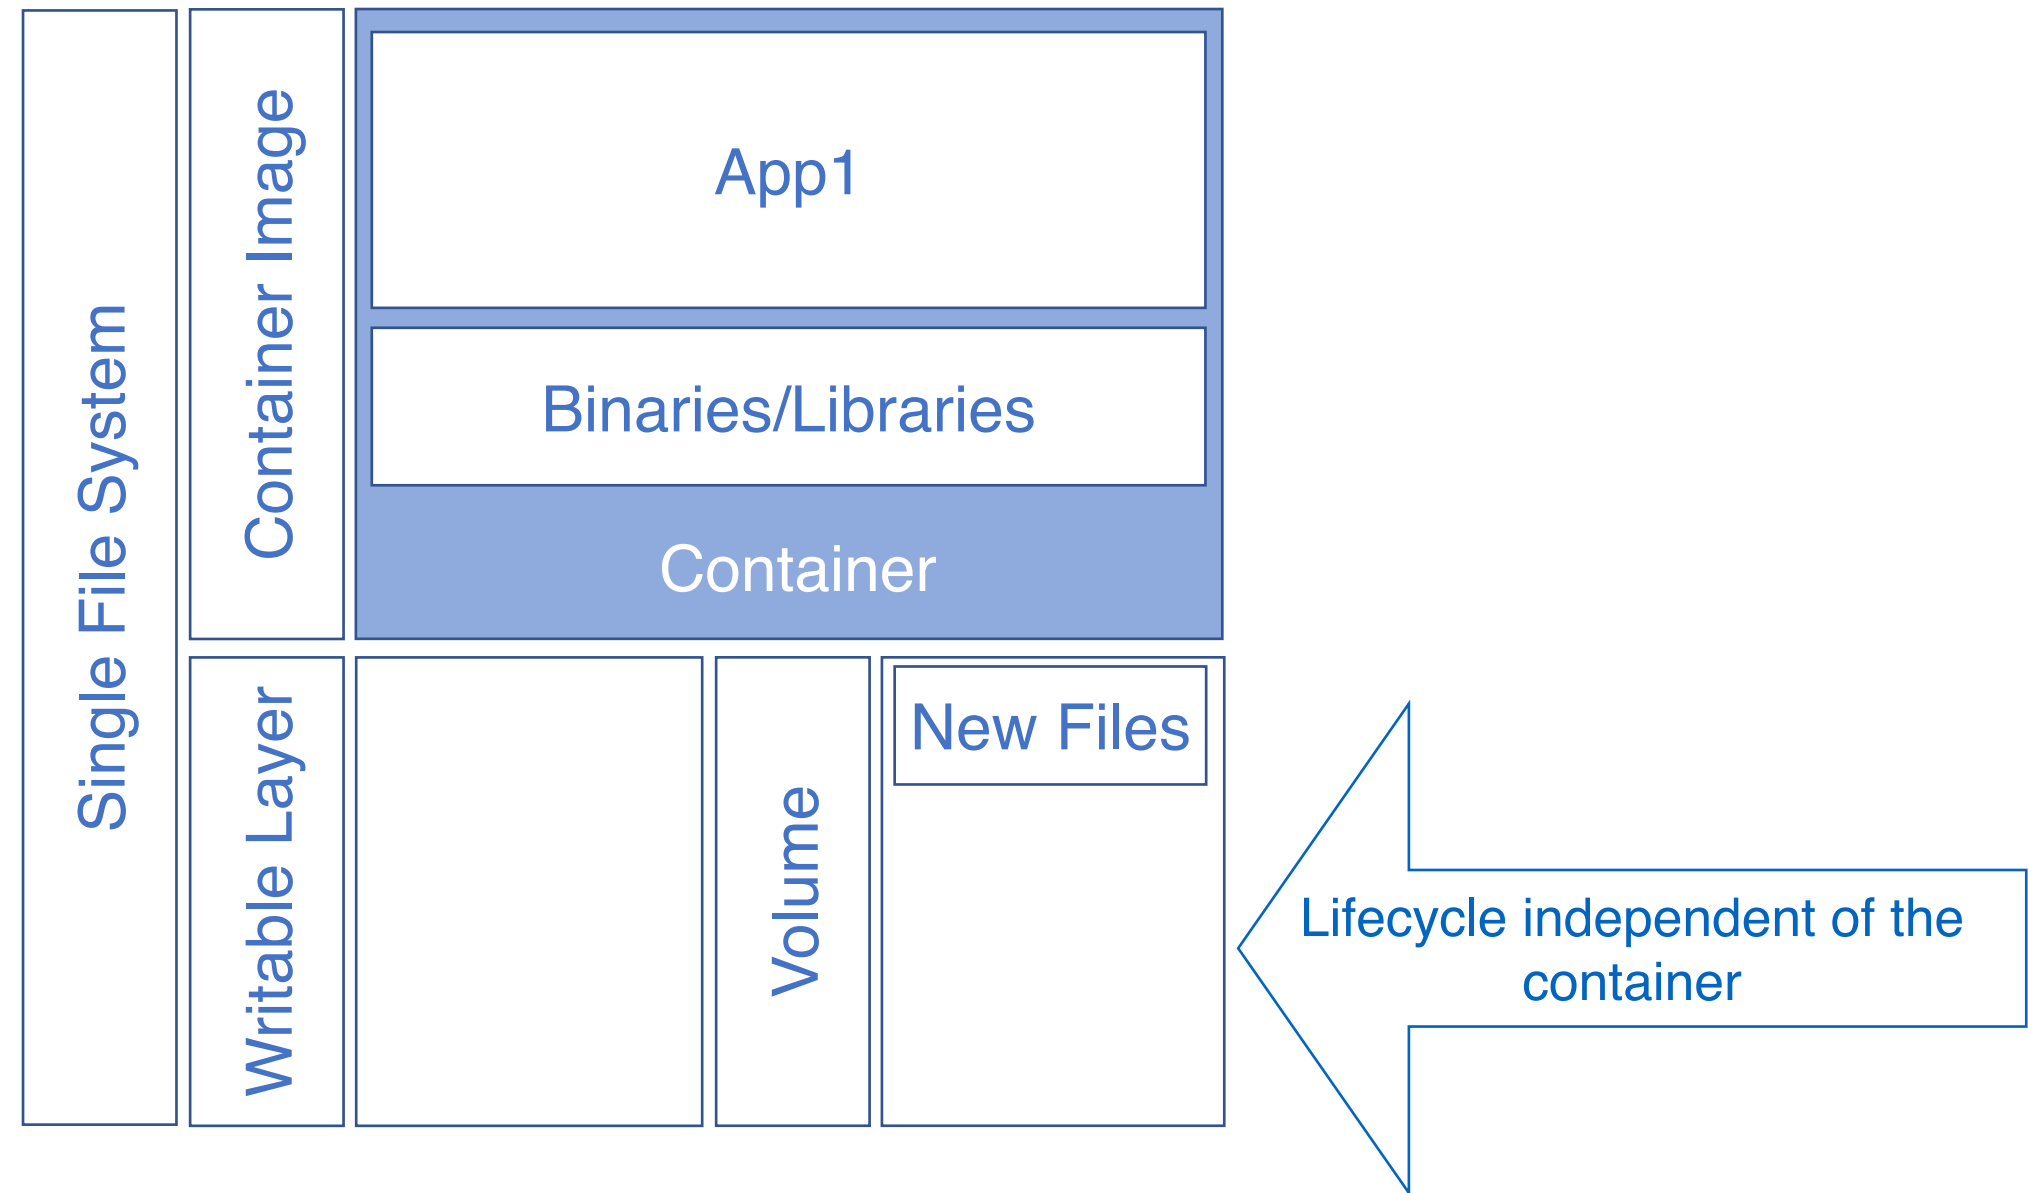

- **Storing Persistent Data in Containers**
- **Non-root Containers**
- **Custom Container Builds with SQL Server Features and Configuration**
- **Getting Data into Your Containers**
- **Container Performance Concepts**

**Containers - You Better Get on Board - [https://youtu.be/VCnh-r\\_tD3U](https://youtu.be/VCnh-r_tD3U)**

# How Containers Store Data

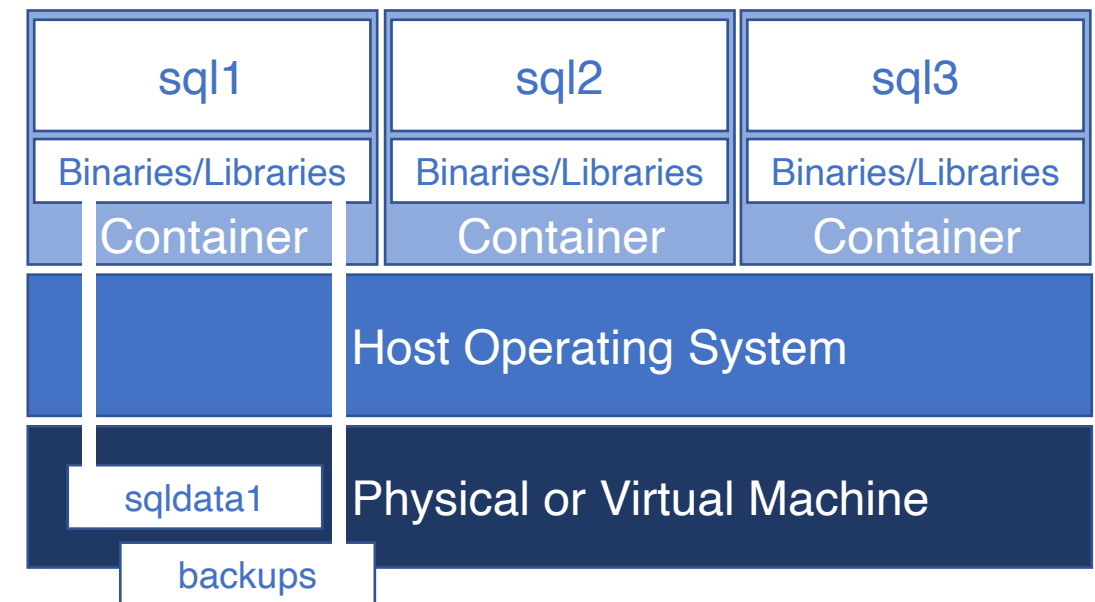

# How Containers Can Store Persistent Data

# Data Persistency in Containers

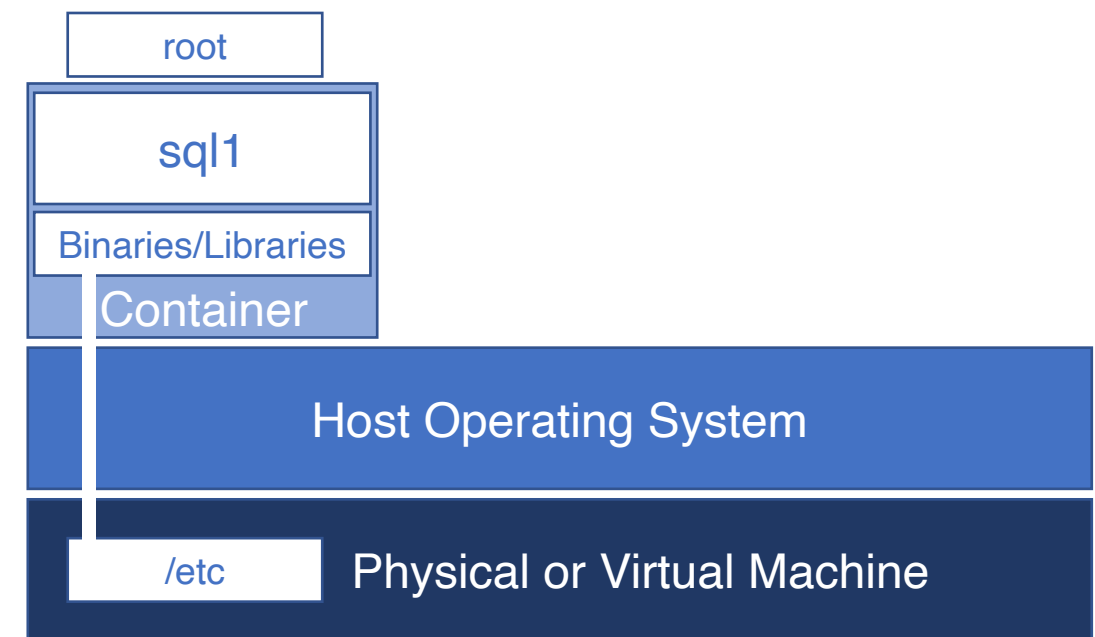

- Docker Data Volumes
  - Generally local storage on the host
  - Volume plugins enable remote storage scenarios
  - Remote storage at the OS level
- You can pre-populate content
  - Backups
  - Database files
  - App code and scripts

<https://docs.docker.com/storage/>

# Non-Root Containers

- SQL Server previously ran as the root user
- Exposes the underlying OS to security risk
  - Docker commands are privileged
- Linux uses on UID and GID for permissions
- Now run as user mssql
- Official MS Images require no config
- When building images you'll need to run some tasks as root then switch to mssql and clean up permissions

# Why Build Your Own Container Image?

**Build Once  
Deploy Many**

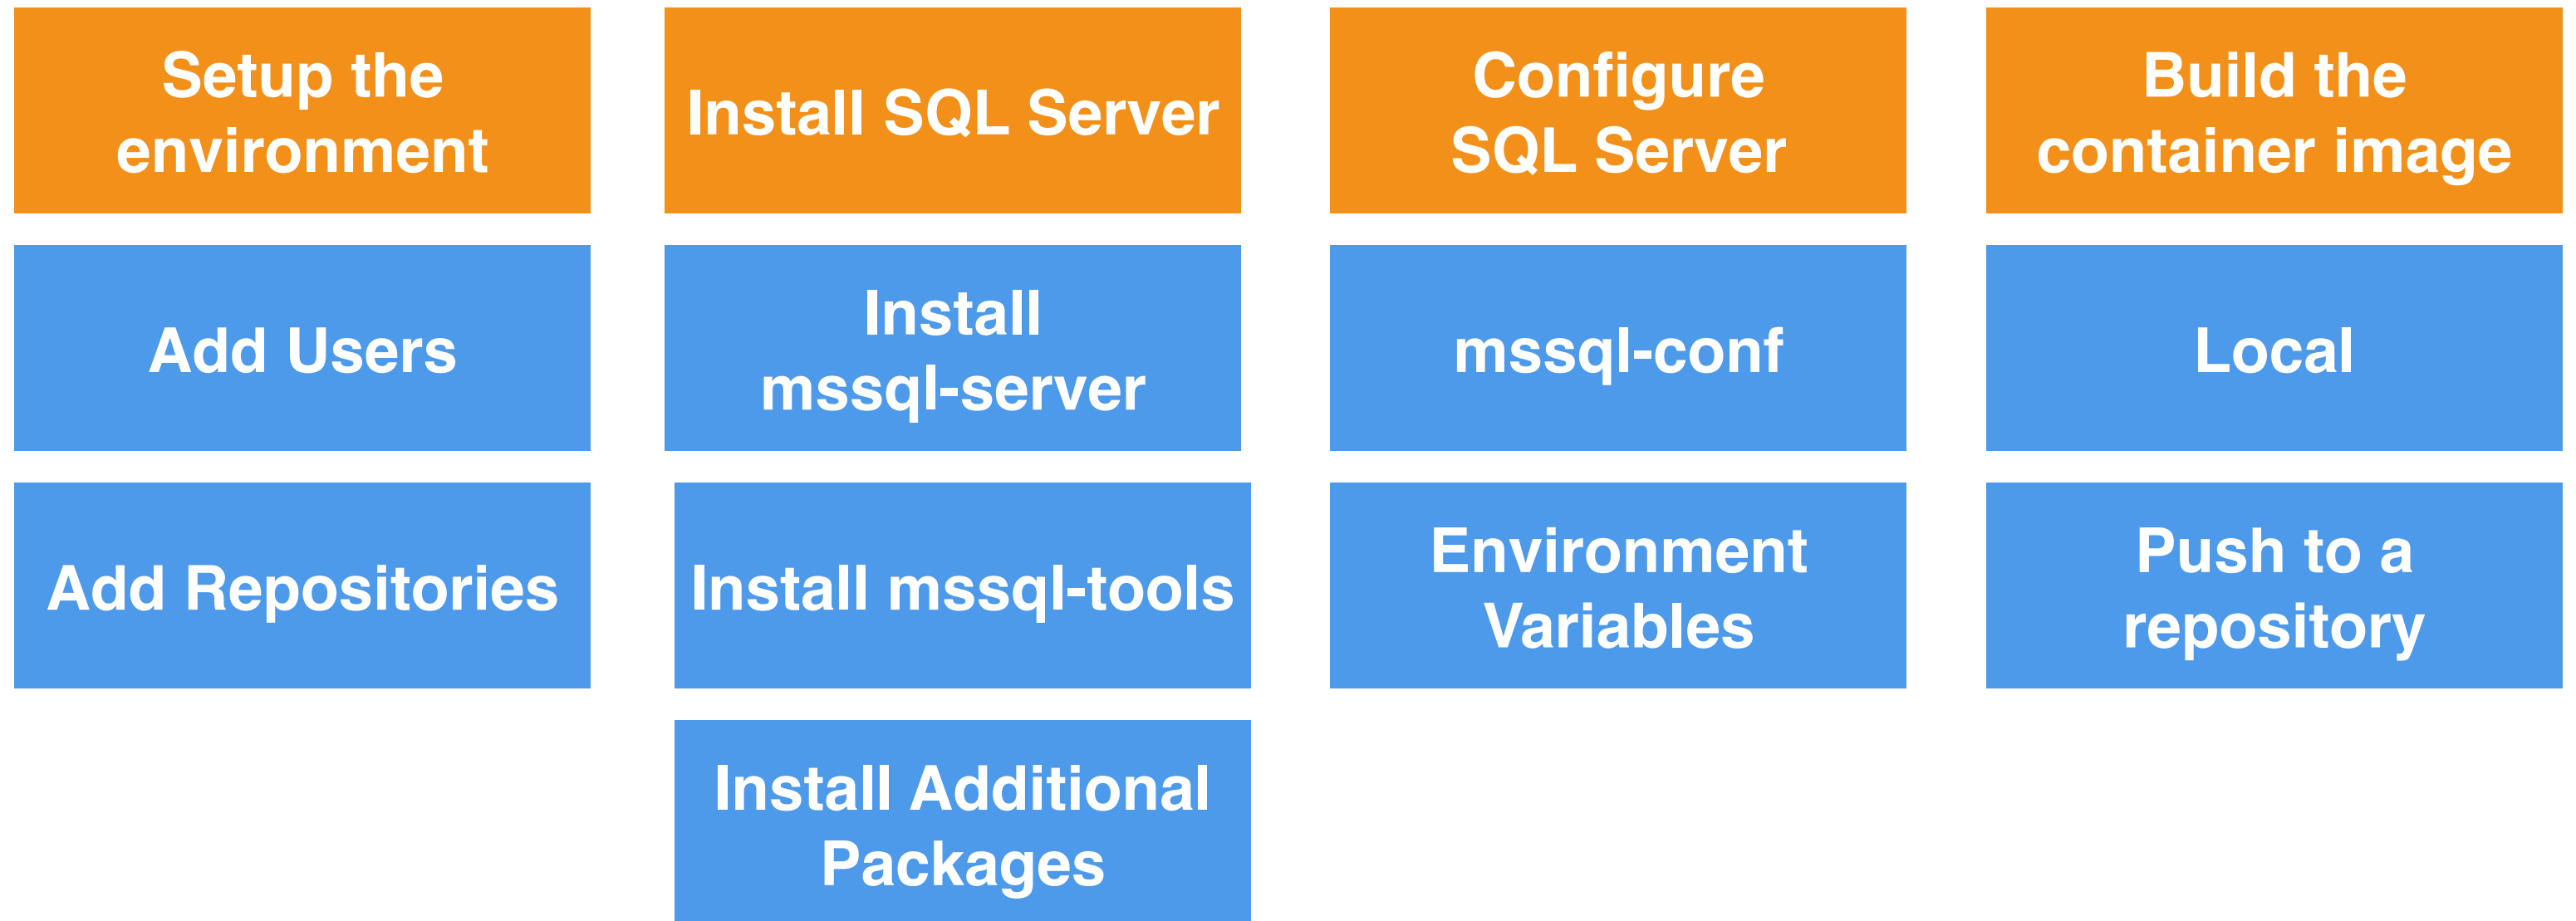

**Customization**

**Control**

**Security**

# SQL Server Custom Container Build Process

<https://docs.microsoft.com/en-us/sql/linux/sql-server-linux-configure-mssql-conf>

<https://docs.microsoft.com/en-us/sql/linux/sql-server-linux-configure-environment-variables>

# Demo!

- **Examine a dockerfile**
- **Creating a Custom Image**
- **Configuring SQL Server**
- **Deploy SQL Server Custom Image as a Container**

# Getting Data Into Your Databases in Containers

- Should I put the databases inside the container image?
  - The size of the database is part of the image
  - On container startup, COW into the writable layer or volume
- Restore or attach a database on container start up
  - Manually or automatically
  - Databases or backups need to be available to SQL Server inside the container
  - Databases or backups can be stored on a mounted volume
  - Local or remote volume
- Seeding larger databases in containers

# Automatically Restoring a Database at Container Deployment

**Call script to execute restore  
or attach**

**Loop sqlcmd test if SQL is  
online**

**Call Script at CMD in  
dockerfile**

# Demo!

- **Restoring databases inside containers**

# Multi-instance Scenarios for SQL Server on Linux Using Containers

- SQL Server on Linux doesn't support named instances
- Containers provide similar functionality
- Deploy with unique
  - Container Names
  - Storage for Data
  - Network ports
- Resource management is your responsibility

# Container-based Performance Concepts

- Resource management is your responsibility
- Sharing the OS and it's hardware
- Resource controls
  - Control groups (cgroups)
- Docker allows you to control access to resources
  - CPU
  - Memory
  - Block IO
  - Process IDs
- Adjustable after container creation

[https://docs.docker.com/config/containers/resource\\_constraints](https://docs.docker.com/config/containers/resource_constraints)

# Container-based Performance Concepts - con't

- CPU
  - **CPU Sets** will limit access to specific CPUs
  - **Limits** influence scheduling
  - **Shares** kick in when CPU is constrained
  - SQL Server will see all CPUs
- Memory Limits will limit access
- `mssql-conf` controls SQL Server's access to memory
- Configuration Best Practices

<https://docs.microsoft.com/en-us/sql/linux/sql-server-linux-performance-best-practices>

# Container-based Monitoring Concepts

- Stabilize the hostname inside the container
  - Enables third party monitoring scenarios
  - DMVs but no WinRM or DCOM/RPC
- docker stats
- Metrics are exposed by docker
- Monitor the base system
- Use restart to keep a container online
  - No, on-failure, always, unless-stopped

# Demo!

- **Define a container using limits**
- **Examine how SQL Server sees the host hardware**
- **Using docker stats to examine performance data**

# Review

- **Storing Persistent Data in Containers**
- **Non-root Containers**
- **Custom Container Builds with SQL Server Features and Configuration**
- **Getting Data into Your Containers**
- **Container Performance Concepts**
